

DATA SCIENCE ASSIGNMENT

Day - 39:

- 1. Which algorithm is commonly used for mining frequent itemsets and generating association rules in a transaction dataset?**
- 2. Which algorithm is specifically designed for discovering sequential patterns in a dataset, where the order of occurrence matters?**
- 3. In the context of market basket analysis, which algorithm is known for its efficiency in finding frequent itemsets without generating candidate itemsets?**
- 4. How does the Apriori Algorithm handle the generation of association rules with different levels of confidence?**
- 5. What is the significance of the header table in the FP-Growth algorithm?**
