DATA SCIENCE ASSIGNMENT

Day - 42:

1. Which type of supervised machine learning task involves predicting continuous numerical values?

2.In a classification task, what is the primary goal of the machine learning model?

3.Which type of machine learning algorithm is commonly used for unsupervised tasks, grouping similar data points together?

4. What are some techniques for improving the efficiency of Association Rule Mining algorithms on large them?

5. Explain the terms "precision" and "recall" in the context of classification evaluation metrics.
