

# BCEA :: CHEAT SHEET

## Introduction

### Bayesian Cost-Effectiveness Analysis in R

Given a random sample of suitable variables of costs (*cost*) and clinical benefits (*eff*) for two or more interventions produces a health economic evaluation. Inputs may be the results of a Bayesian model (possibly based on MCMC) in the form of simulations from the posterior distributions. For *ssample* points compares one of the *minterventions* (*reference*) to the others (*.comparison*).

**bcea**(*eff*, *cost*, *ref*, *.comparison*, *interventions*)

### INPUT ARRAY PAIRCONSTITUENT FUNCTIONS

*cost*  
**compute\_U()** : Expected utility for each WTP & intervention  
**compute\_Ustar()** : Maximum 'known-distribution' utility for each WTP  
*eff*  
**compute\_vi()** : Value of information for each WTP  
**bcea()**  
**compute\_ol()** : Opportunity Loss for each WTP  
**compute\_ICER()** : Incremental cost-effectiveness ratio  
**compute\_IB()** : Incremental benefit for each WTP  
**compute\_CEAC()** : Cost-effectiveness acceptability for each WTP  
**compute\_EIB()** : Expected incremental benefit for each WTP  
*m*  
**compute\_kstar()** : WTP break-even value

**bcea()** calculates numerous cost-effectiveness analysis statistics. These can be called directly, using the constituent functions, but would require some pre-processing which is already handled by **bcea()**.

## Value assignment

There are 3 equivalent ways to assign values to analysis parameters.

1. *In Constructor*: When first creating a **bcea** object.

```
he <- bcea(eff, cost, ref, .comparison, ...)
```

2. *Using Setters*: Change directly using replacement functions.

```
setComparison(he) <- comparison  
setKmax(he) <- Kmax  
setReference(he) <- ref
```

3. *In plotting call*: At the point of making a plot.

```
eib.plot(he, comparison, ...)  
ceac.plot(he, comparison, ...)  
ceplane.plot(he, comparison, ...)
```

### SELECTING ANALYSIS INTERVENTIONS

#### Default

The first columns in (*eff*, *cost*) are the default reference intervention. All other interventions are the comparison interventions unless defined otherwise. E.g. for *minterventions*

## Plot

Standard cost-effectiveness analysis output plots. Base R, ggplot2 and plotly versions of plots are available and can be called directly but require extra default parameters.

### Cost-effectiveness acceptability curve

**Expected incremental benefit**  
**ceac.plot**(*he*, *comparison* = NULL, *pos* = c(1, 0), *graph* = c("base", "ggplot2", "plotly"), ...)  
calls: **ceac\_plot\_base()**  
calls: **eib\_plot\_base()** **ceac\_plot\_ggplot()**

**eib\_plot\_ggplot()** **ceac\_plot\_plotly()**  
**eib\_plot\_plotly()** **Cost-effectiveness plane**

### Expected value of information

**ceplane.plot**(*he*, *comparison* = NULL, *pos* = c(1, 0), *graph* = c("base", "ggplot2", "plotly"), ...)  
calls: **ceplane\_plot\_base()**

### Cost-effectiveness planes with contours

**ceplane.plot\_ggplot()** **ceplane.plot\_plotly()**  
**Grid of CE plane, EIB, EVI & CEAC**  
**plot.bcea**(*x*, *comparison* = NULL, *pos* = c(1, 0), *graph* = c("base", "ggplot2", "plotly"), ...)

### Compare optimal scenario to mixed case

**plot.mixedAn**(*x*, *y.limits* = NULL, *pos* = c(0, 0.8), *graph* = c("base", "ggplot2", "plotly"), ...)

NULL, *pos* = c(1, 0), *graph* = c("base", "ggplot2", "plotly"), ...)

**plot.bcea**(*x*, *comparison* = NULL, *pos* = c(1, 0), *graph* = c("base", "ggplot2", "plotly"), ...)

### Expected value of perfect partial information

## Summarise data

Summary statistics and formatted tables can be used to interrogate a **bcea()** object.

### summary.bcea(he, ...)

Prints a table with summary results of the health economic evaluation

### summary.mixedAn(he, ...)

Prints summary table for results of mixed analysis

### sim.table(he, ...)

Summary table of simulations from the cost-effectiveness analysis

### make.report(he, ...)

Constructs the automated report from the output of the BCEA
