

Install Apache Hive on Ubuntu

To configure Apache Hive, first you need to download and unzip Hive. Then you need to customize the following files and settings:

- · Edit .bashrc file
- · Edit **hive-config.sh** file
- · Create **Hive directories** in HDFS
- · Configure hive-site.xml file
- · Initiate Derby database

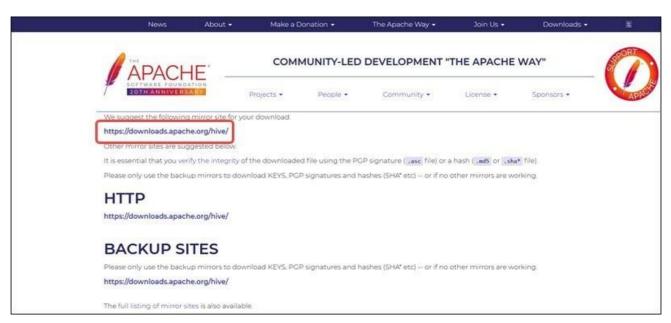

Step 1: Download and Untar Hive

Visit the <u>Apache Hive official download page</u> and determine which Hive version is best suited for your Hadoop edition. Once you establish which version you need, select the **Download a Release Now!** option.

The mirror link on the subsequent page leads to the directories containing available Hive tar packages. This page also provides useful instructions on how to validate the integrity of files retrieved from mirror sites.

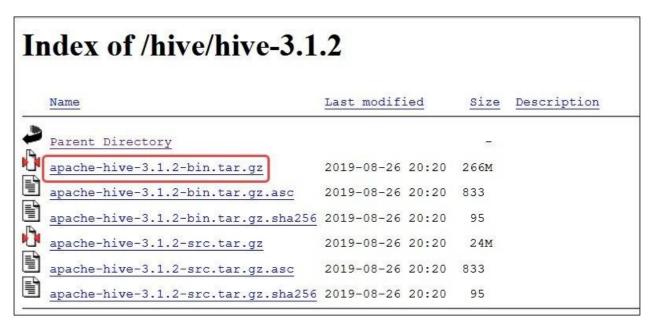

The Ubuntu system presented in this guide already has **Hadoop 3.2.1** installed. This Hadoop version is compatible with the **Hive 3.1.2** release.

dex of /hive				
Name	Last modified		Size	Description
Parent Directory			(1475) 172 <u>11</u> 73	
hive-1.2.2/	2018-05-04	20:51	: - -1	
hive-2.3.7/	2020-04-17	22:03	174	
hive-3.1.2/	2019-08-26	20:21	-T-1	
hive-standalone-metastore-3.0.0/	2018-06-07	18:12	-	
hive-storage-2.6.1/	2018-05-11	22:26	177.1	
hive-storage-2.7.2/	2020-05-11	16:00	(7)	
stable-2/	2020-04-17	22:03	-	
KEYS	2020-01-17	22:47	82K	

Select the **apache-hive-3.1.2-bin.tar.gz** file to begin the download process.

Alternatively, access your Ubuntu command line and download the compressed Hive files using and the wget command followed by the download path:

wget https://downloads.apache.org/hive/hive-3.1.2/apache-hive-3.1.2-bin.tar.gz

```
hdoop@phoenixnap:~$ wget https://downloads.apache.org/hive/hive-3.1.2/apache-hi ve-3.1.2-bin.tar.gz --2020-06-01 08:11:30-- https://downloads.apache.org/hive/hive-3.1.2/apache-hi ve-3.1.2-bin.tar.gz Resolving downloads.apache.org (downloads.apache.org)... 88.99.95.219, 2a01:4f8 :10a:201a::2 Connecting to downloads.apache.org (downloads.apache.org)|88.99.95.219|:443... connected. HTTP request sent, awaiting response... 200 OK Length: 278813748 (266M) [application/x-gzip] Saving to: 'apache-hive-3.1.2-bin.tar.gz' apache-hive-3.1.2-b 100%[===================] 265.90M 10.9MB/s in 25s 2020-06-01 08:11:55 (10.7 MB/s) - 'apache-hive-3.1.2-bin.tar.gz' saved [2788137 48/278813748]
```

Once the download process is complete, untar the compressed Hive package:

```
tar xzf apache-hive-3.1.2-bin.tar.gz
```

The Hive binary files are now located in the *apache-hive-3.1.2-bin* directory.

Step 2: Configure Hive Environment Variables (bashrc)

The \$HIVE_HOME environment variable needs to direct the client shell to the *apache-hive-3.1.2-bin* directory. Edit the *.bashrc* shell configuration file using a text editor of your choice (we will be using nano):

```
sudo nano .bashrc
```

Append the following Hive environment variables to the .bashrc file:

```
export HIVE_HOME= "home/hdoop/apache-hive-3.1.2-bin"
export PATH=$PATH:$HIVE HOME/bin
```

The Hadoop environment variables are located within the same file.

```
m
                                hdoop@phoenixnap: ~
                                                             Q
                                       .bashrc
 GNU nano 4.8
if I shopt -oq posix; then
  tf [ -f /usr/share/bash-completion/bash_completion ]; then
    . /usr/share/bash-completion/bash_completion
  elif [ -f /etc/bash_completion ]; then
    . /etc/bash_completion
export HADOOP_HOME=/home/hdoop/hadoop-3.2.1
export HADOOP INSTALL
export HADOOP MAPRED HOME=
export HADOOP COMMON HOME-
EXPORT HADOOP HDFS HOME
export YARN_HOME=
                                                 /lib/native
export HADOOP COMMON LIB NATIVE DIR=
                              /sbin
export PATH
export HADOOP_OPTS="-Djava.library.path=$HADOOP_HOME/lib/native"
export HIVE_HOME="/home/hdoop/apache-hive-3.1.2-bin"
export PATH
                             /bin
                                                                Justify
  Get Help
                  Write Out
                                 Where Is
                                                 Cut Text
                                                              ^3
                                 Replace
   Exit
               ^R
                  Read File
                                                 Paste Text
                                                                To Spell
```

Save and exit the .bashrc file once you add the Hive variables. Apply the changes to the current environment with the following command:

```
source ~/.bashrc
```

Step 3: Edit hive-config.sh file

Apache Hive needs to be able to interact with the Hadoop Distributed File System. Access the *hive-config.sh* file using the previously created **\$HIVE HOME** variable:

```
sudo nano $HIVE HOME/bin/hive-config.sh
```

Note: The *hive-config.sh* file is in the *bin* directory within your Hive installation directory.

Add the **HADOOP HOME** variable and the full path to your Hadoop directory:

```
export HADOOP HOME=/home/hdoop/hadoop-3.2.1
```

```
# Allow alternate conf dir location.
HIVE_CONF_DIR="${HIVE_CONF_DIR:-$HIVE_HOME/conf}"

export HIVE CONF_DIR="/home/hdoop/apache-hive-3.1.2-bin/conf"
export HADOOP_HOME=/home/hdoop/hadoop-3.2.1
```

Save the edits and exit the *hive-config.sh* file.

Step 4: Create Hive Directories in HDFS

Create two separate directories to store data in the HDFS layer:

- The temporary, *tmp* directory is going to store the intermediate results of Hive processes.
- The warehouse directory is going to store the <u>Hive related tables</u>.

Create tmp Directory

Create a *tmp* directory within the HDFS storage layer. This directory is going to store the intermediary data Hive sends to the HDFS:

```
hdfs dfs -mkdir /tmp
```

Add write and execute permissions to tmp group members:

```
hdfs dfs -chmod q+w /tmp
```

Check if the permissions were added correctly:

```
hdfs dfs -ls /
```

The output confirms that users now have write and execute permissions.

```
hdoop@phoenixnap:~$ hdfs dfs -ls /
Found 4 items
drwxr-xr-x - hdoop supergroup 0 2020-06-02 02:37 /Exampledir
drwxrwxr-x - hdoop supergroup 0 2020-06-02 07:26 /tmp
```

Create warehouse Directory

Create the *warehouse* directory within the */user/hive/* parent directory:

```
hdfs dfs -mkdir -p /user/hive/warehouse
```

Add write and execute permissions to warehouse group members:

```
hdfs dfs -chmod g+w /user/hive/warehouse
```

Check if the permissions were added correctly:

```
hdfs dfs -ls /user/hive
```

The output confirms that users now have write and execute permissions.

```
hdoop@phoenixnap:~$ hdfs dfs -ls /user/hive
Found 1 items
drwxrwxr-x - hdoop supergroup 0 2020-06-02 09:06 /user/hive/warehous
e
```

Step 5: Configure hive-site.xml File (Optional)

Apache Hive distributions contain template configuration files by default. The template files are located within the Hive *conf* directory and outline default Hive settings.

Use the following command to locate the correct file:

```
cd $HIVE HOME/conf
```

List the files contained in the folder using the ls command.

```
hdoop@phoenixnap:~$ cd $HIVE_HOME/conf
hdoop@phoenixnap:~/apache-hive-3.1.2-bin/conf$ ls
beeline-log4j2.properties.template
hive-default.xml.template ivysettings.xml
hive-env.sh.template llap-cli-log4j2.properties.template
hive-exec-log4j2.properties.template llap-daemon-log4j2.properties.template
hive-log4j2.properties.template parquet-logging.properties
```

Use the *hive-default.xml.template* to create the *hive-site.xml* file:

```
cp hive-default.xml.template hive-site.xml
```

Access the *hive-site.xml* file using the nano text editor:

```
sudo nano hive-site.xml
```

Note: The hive-site.xml file controls every aspect of Hive operations. The number of available advanced settings can be overwhelming and highly specific. Consult the <u>official Hive Configuration</u> <u>Documentation</u> regularly when customizing Hive and Hive Metastore settings.

Using Hive in a stand-alone mode rather than in a real-life Apache Hadoop cluster is a safe option for newcomers. You can configure the system to use your local storage rather than the HDFS layer by setting the *hive.metastore.warehouse.dir* parameter value to the location of your Hive *warehouse* directory.

```
Modified
GNU nano 4.8
                                hive-site.xml
property
  <name>hive.metastore.db.type</name>
  <value>DERBY</value>
    Expects one of [derby, oracle, mysql, mssql, postgres].
                                                                    JDBCSto>
    Type of database used by the metastore. Information schema
  <name>hive.metastore.warehouse.dir
 <value>/user/hive/warehouse</value>
  <description>location of default database for the warehouse</description>
cproperty>
  <name>hive.metastore.warehouse.external.dir</name>
 <description>Default location for external tables created in the warehouse>
</property>
 <name>hive.metastore.uris
  <description>Thrift URI for the remote metastore. Used by metastore client>
 <name>hive.metastore.uri.selection</name>
```

Step 6: Initiate Derby Database

Apache Hive uses the Derby database to store metadata. Initiate the Derby database, from the Hive *bin* directory using the **schematool** command:

```
$HIVE_HOME/bin/schematool -dbType derby -initSchema
```

The process can take a few moments to complete.

Derby is the default metadata store for Hive. If you plan to use a different database solution, such as MySQL or PostgreSQL, you can specify a database type in the *hive-site.xml* file.

How to Fix guava Incompatibility Error in Hive

If the Derby database does not successfully initiate, you might receive an error with the following content:

"Exception in thread "main" java.lang.NoSuchMethodError: com.google.common.base.Preconditions.checkArgument(ZLjava/lang/String;Ljava/lang/Object;)V"

This error indicates that there is most likely an incompatibility issue between Hadoop and Hive *guava* versions.

Locate the **guava jar** file in the Hive *lib* directory:

```
ls $HIVE HOME/lib
```

```
esri-geometry-api-2.0.0.jar
findbugs-annotations-1.3.9-1.jar
flatbuffers-1.2.0-3f79e055.jar
groovy-all-2.4.11.jar
gson-2.2.4.jar
guava- 19.0.jar
hbase-client-2.0.0-alpha4.jar
hbase-common-2.0.0-alpha4.jar
hbase-common-2.0.0-alpha4.jar
hbase-hadoop2-compat-2.0.0-alpha4.jar
```

Locate the **guava jar** file in the Hadoop *lib* directory as well:

ls \$HADOOP HOME/share/hadoop/hdfs/lib

```
curator-recipes-2.13.0.jar
dnsjava-2.1.7.jar
error_prone_annotations-2.2.0.jar
failureaccess-1.0.jar
gson-2.2.4.jar
guava-27.0-jre.jar
hadoop-annotations-3.2.1.jar
hadoop-auth-3.2.1.jar
htrace-core4-4.1.0-incubating.jar
```

The two listed versions are not compatible and are causing the error. Remove the existing **guava** file from the Hive *lib* directory:

```
rm $HIVE HOME/lib/guava-19.0.jar
```

Copy the **guava** file from the Hadoop *lib* directory to the Hive *lib* directory:

```
cp $HADOOP_HOME/share/hadoop/hdfs/lib/guava-27.0-jre.jar $HIVE_HOME/lib/
```

Use the **schematool** command once again to initiate the Derby database:

```
$HIVE HOME/bin/schematool -dbType derby -initSchema
```

Launch Hive Client Shell on Ubuntu

Start the Hive command-line interface using the following commands:

cd \$HIVE_HOME/bin

hive

You are now able to issue SQL-like commands and directly interact with HDFS.

```
hdoop@phoenixnap:~$ cd $HIVE_HOME/bin
hdoop@phoenixnap:~/apache-hive-3.1.2-bin/bin$ hive
SLF4J: Class path contains multiple SLF4J bindings.

hive>
```

Conclusion

You have successfully installed and configured Hive on your Ubuntu system. Use HiveQL to query and manage your Hadoop distributed storage and perform SQL-like tasks. Your Hadoop cluster now has an easy-to-use gateway to previously inaccessible RDBMS.
