

CloudSim

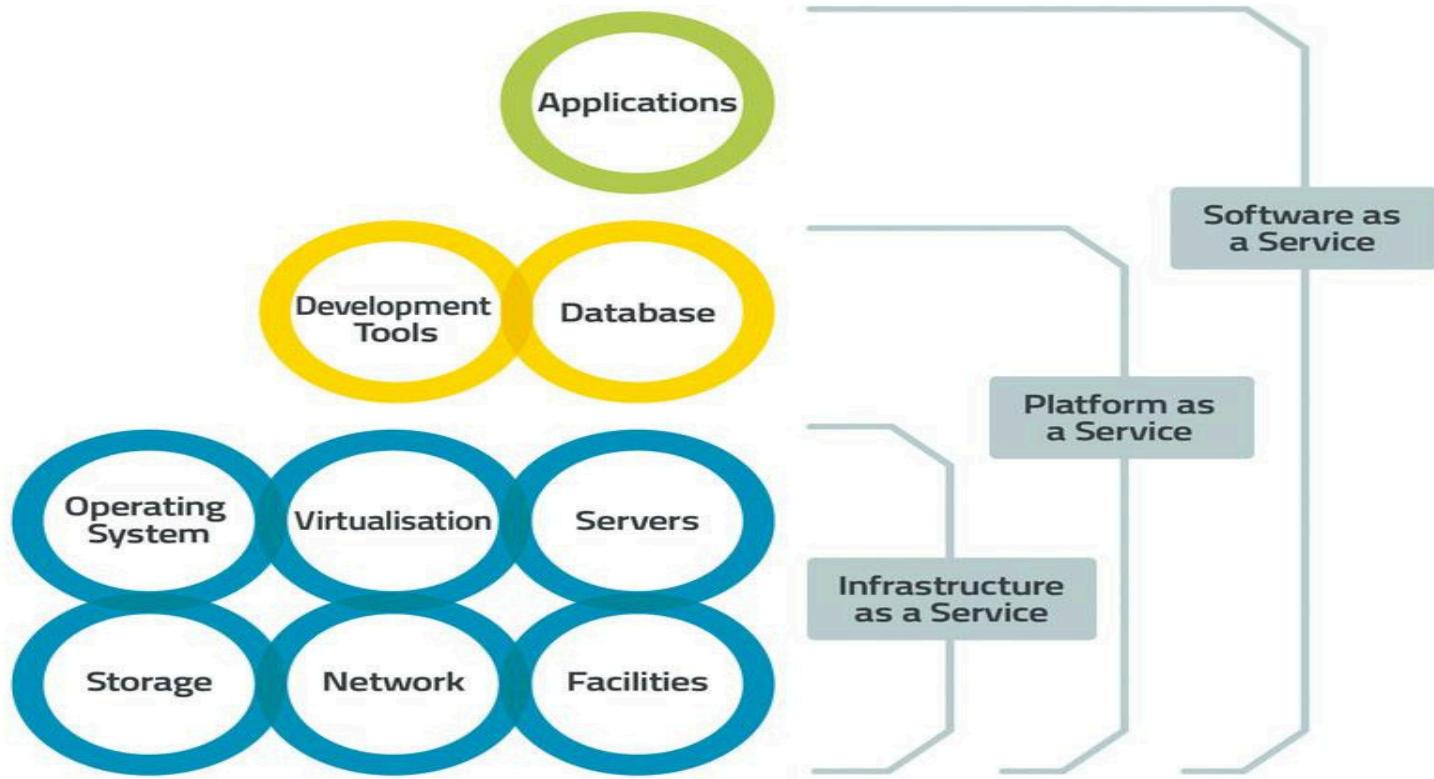

Cloud Simulation Toolkit

Agenda

- Introduction - Cloud Computing & Cloudsim.
- Essentials to start with Cloudsim. Insight on
- Cloudsim modeled components. Insight on
- Cloudsim simulation process. Hands-on
- examples.

Introduction - Cloud Computing Service Stack

Cloud Infrastructure Challenges for researchers

- Cloud exhibit varying demands, supply patterns, system sizes and resources.
- Users have heterogeneous, dynamic and competing QoS requirements.
- Applications have varying performance, workload and dynamic application scaling requirements.
- due to third party ownership,no flexibility on configuration and cost.

re-producing reliable results and benchmarking is extremely difficult.

Cloudsim - a viable alternative

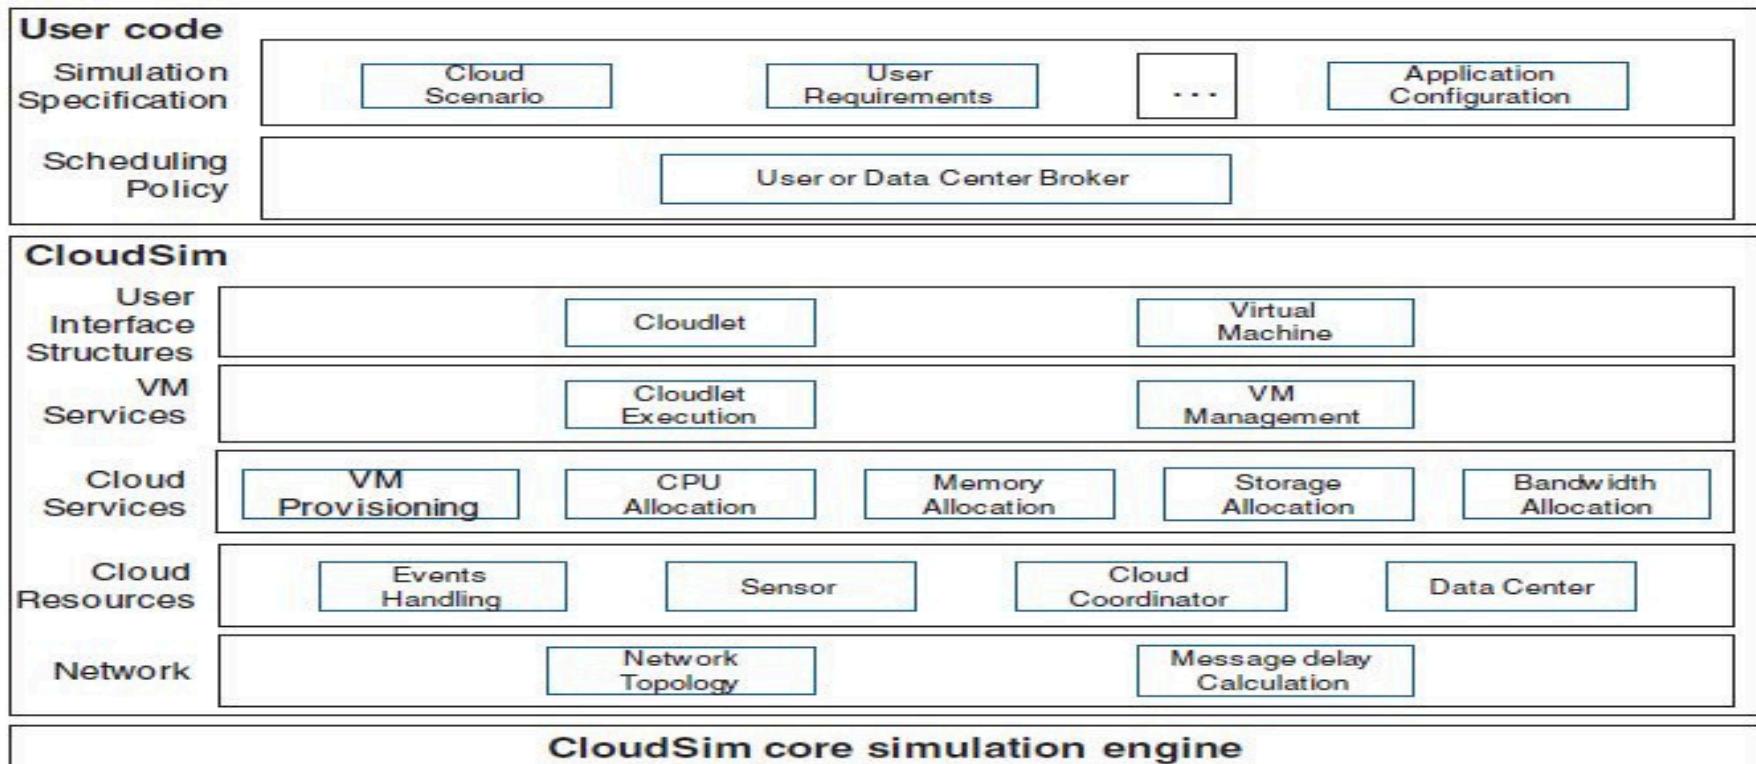

- Hasslefree extensible modeling and event based simulation of large scale cloud infrastructure with support of virtualization engine.
- Self contained platform for modeling:
 - Clouds,
 - Service brokers
 - Provisioning and allocation policies.
- Flexibility to switch between:
 - Space-shared
 - Time-shared allocation, at all the levels.
- simulation of network connections among the simulated systems elements.
- Support for federated cloud environment.

Cloudsim-Directory structure

— — —

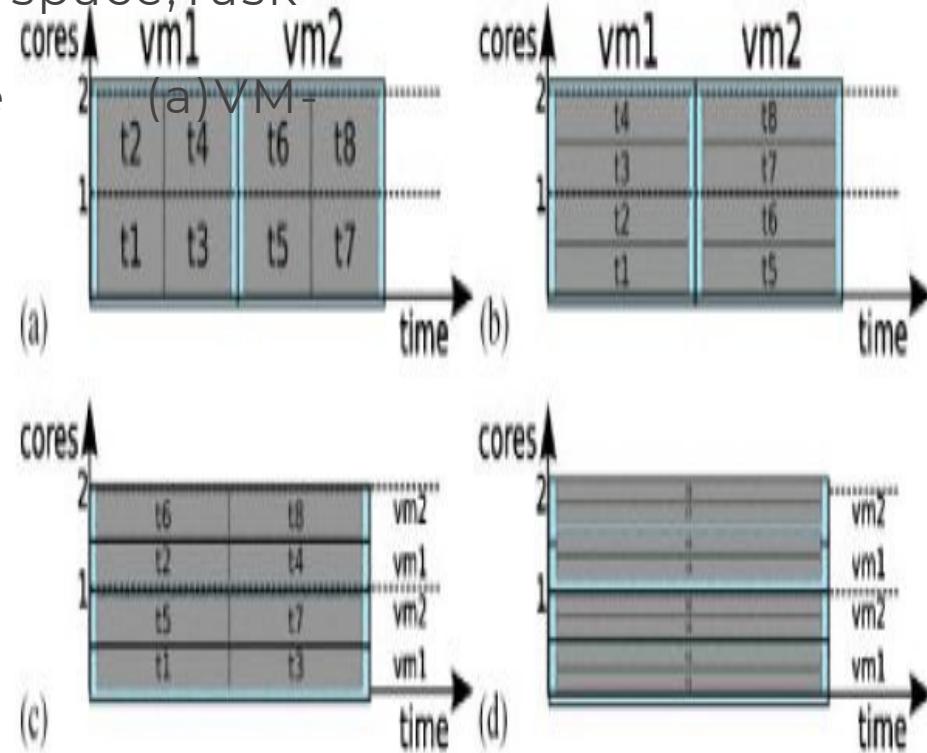

- cloudsim/ -- top level CloudSim directory
 - docs/ -- CloudSim API Documentation
 - examples/ -- CloudSim examples
 - jars/ -- CloudSim jar archives
 - sources/ -- CloudSim source code

Cloudsim - Layered Architecture

Cloudsim - Time/Space shared models

(a) VM-space, Task-space (b) VM-time
time (c) VM-time, Task-space
time, Task-time

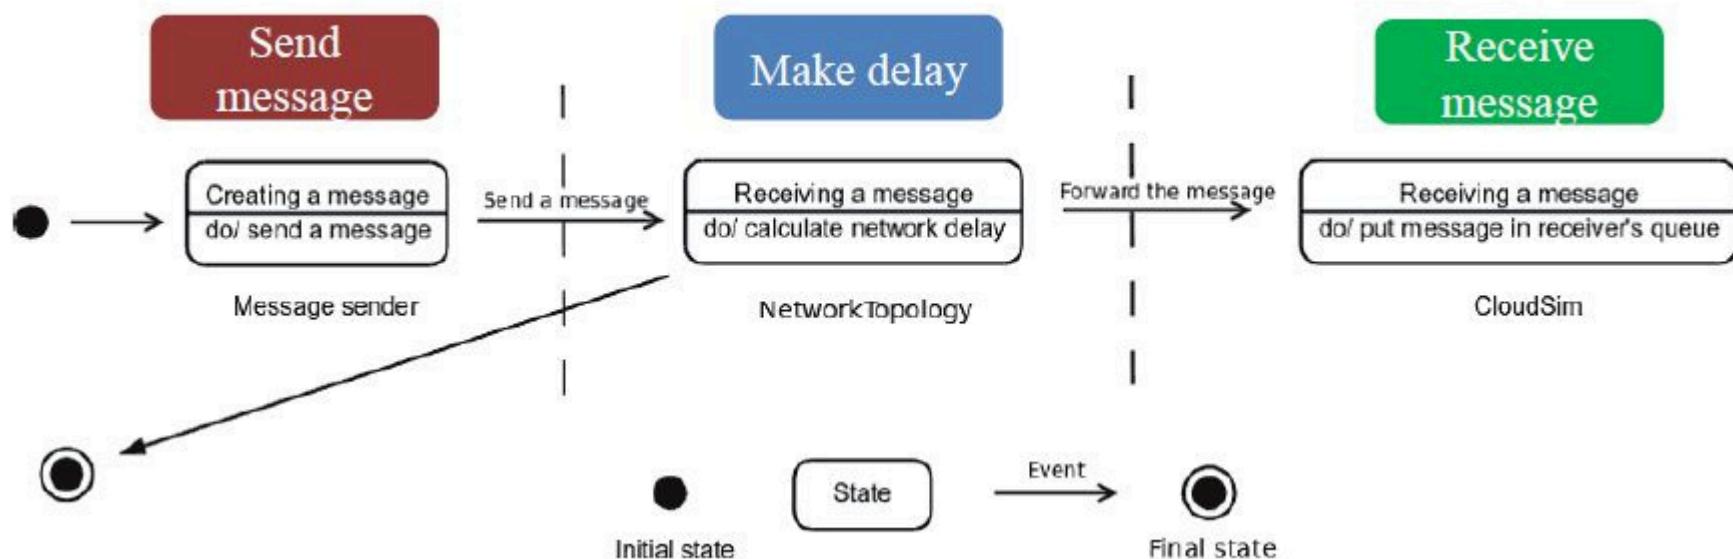

Cloudsim - Network latency matrix using BRITE

E^{--}

$_{ij}$ = Delay from entity i to entity j

$$\begin{bmatrix} 0 & 40 & 120 & 80 & 200 \\ 40 & 0 & 60 & 100 & 100 \\ 120 & 60 & 0 & 90 & 40 \\ 80 & 100 & 90 & 0 & 70 \\ 200 & 100 & 40 & 70 & 0 \end{bmatrix}$$

Cloudsim - Network latency behavior

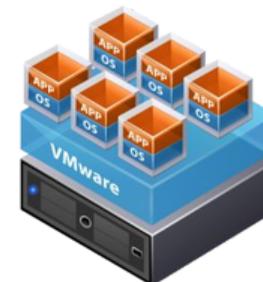

Components of Virtualized Infrastructure

Cloudsim - Component model classes

- CloudInformationService.java
- Datacenter.java, Host.java, Pe.java
- Vm.java, Cloudlet.java DatacenterBroker.java
- Storage.java, HarddriveStorage.java, SanStorage.java
-

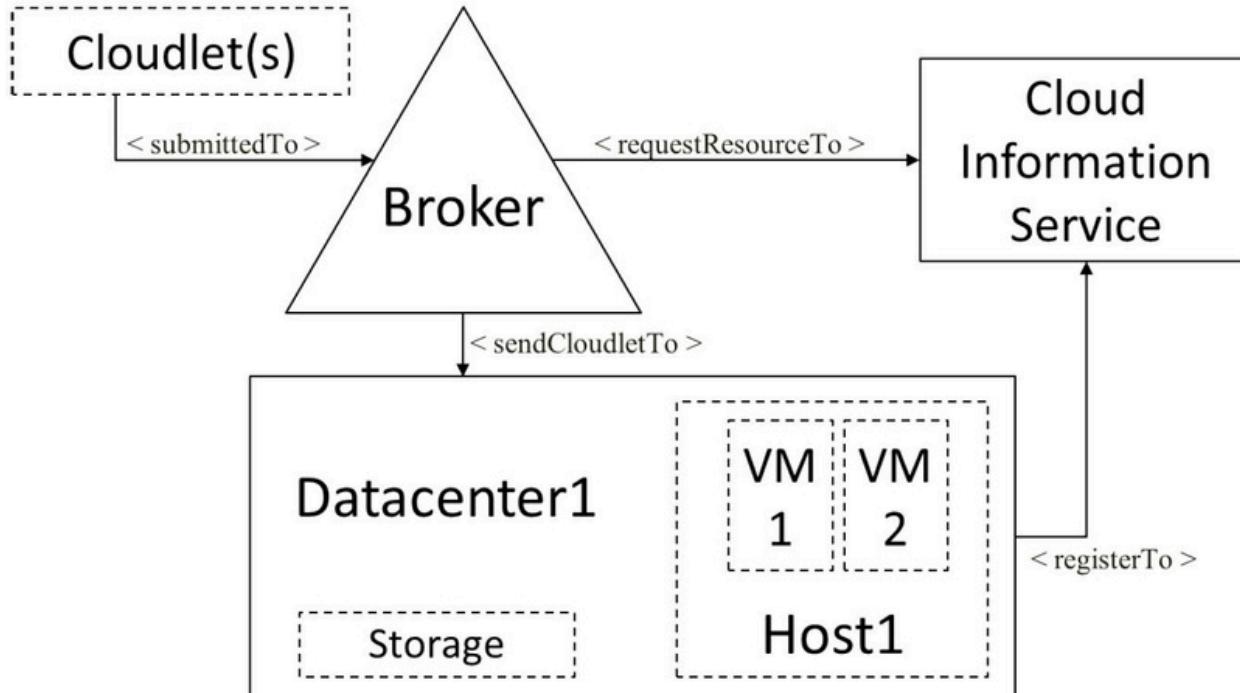

Cloudsim - Major blocks/Modules

- org.cloudbus.cloudsim
- **org.cloudbus.cloudsim.core**
- org.cloudbus.cloudsim.core.predicates
- org.cloudbus.cloudsim.distributions
- org.cloudbus.cloudsim.lists
- org.cloudbus.cloudsim.network
- org.cloudbus.cloudsim.network.datacente
- r org.cloudbus.cloudsim.power
- org.cloudbus.cloudsim.power.lists
- org.cloudbus.cloudsim.power.models
- org.cloudbus.cloudsim.provisioners
- org.cloudbus.cloudsim.util

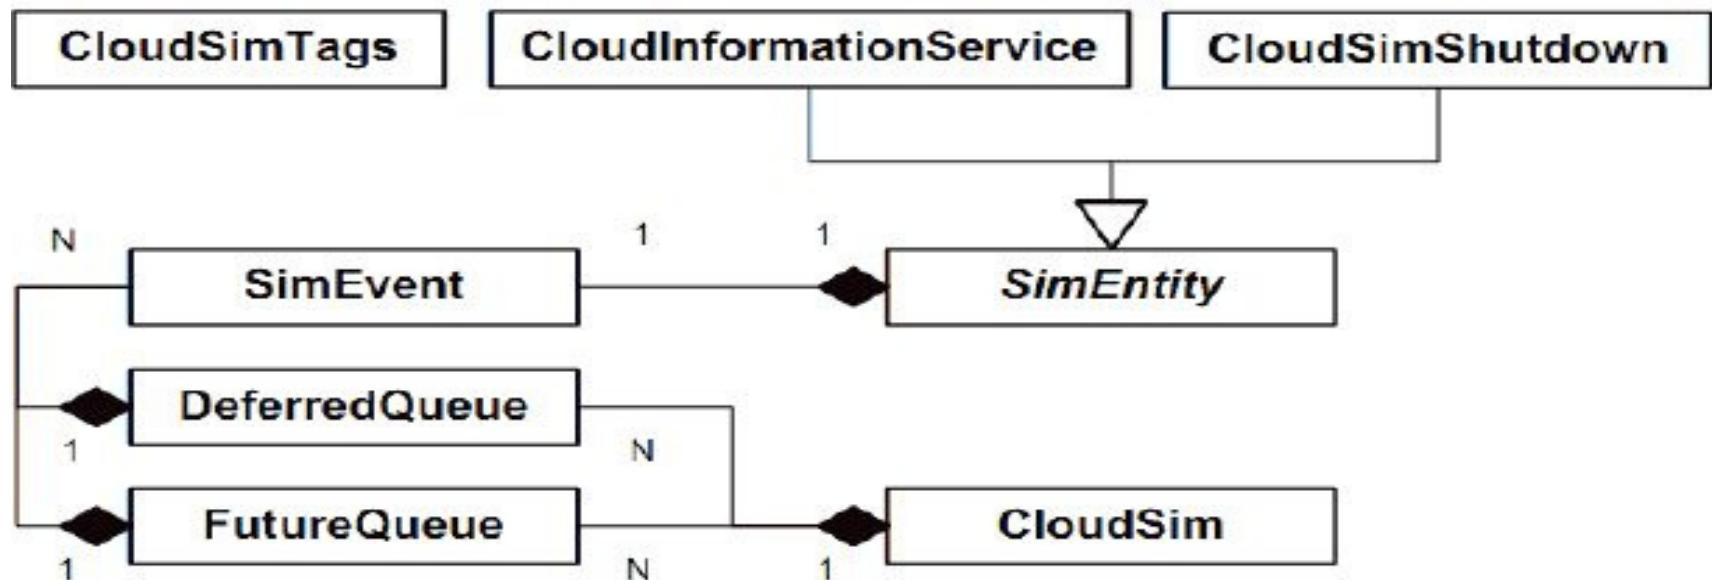

Cloudsim - key components

- Datacenter
- DataCenterCharacteristics
- Host
- DatacenterBroker
- RamProvisioner
- BwProvisioner
- Storage
- Vm
- VMAllocationpolicy
- VmScheduler
- Cloudlet
- CloudletScheduler
- CloudInformationService
- CloudSim
- CloudSimTags
- SimEvent
- SimEntity
- CloudsimShutdown
- FutureQueue
- DefferedQueue
- Predicate and associative classes.

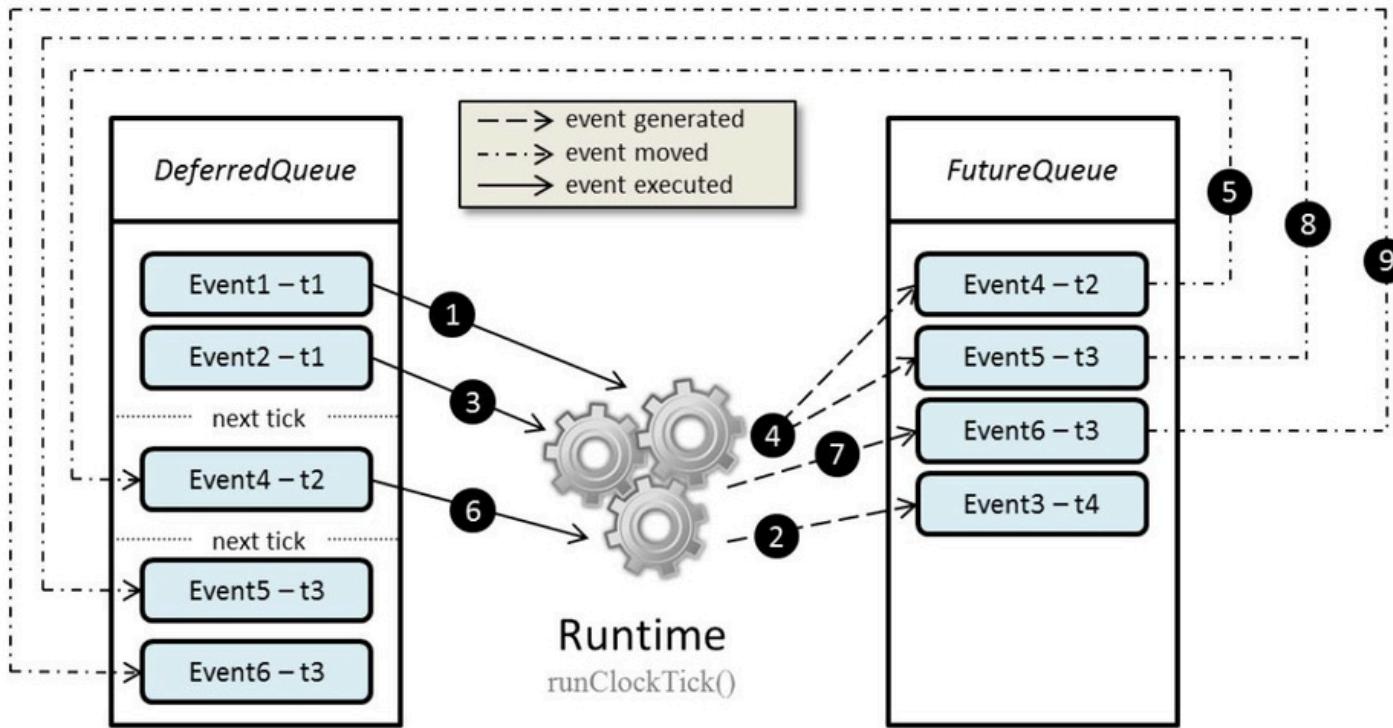

Simulation flow for basic scenario

Cloudsim - Core simulation framework

Task execution Queue management

Cloudsim - General steps to follow

- Initiate the cloudsim simulation.
- create a datacenter.
- create a datacenter broker.
- create VMs/cloudlet add it to respective lists.
- submit vm and cloudlet list to borker.
- start simulation.
- stop simulation.
- print the end results.
